Ideation Phase
Brainstorm & Idea Prioritization Template

Date	3october2026
Team ID	SWTID-2026-9253
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	4 Marks

Step-1: Team Gathering, Collaboration and Select the Problem Statement

The team gathered to discuss the challenges involved in importing employee data into ServiceNow. During the discussion, different methods of entering and transferring data were considered, including manual record creation and automated data import. The team identified that manually entering multiple employee records can be time-consuming and may result in data-entry errors or inconsistent information. Based on the discussion, the team selected the problem statement **"Import Data Using Transform Maps in ServiceNow."**

The selected problem focuses on importing employee data from a source file into a ServiceNow target table using **Import Sets and Transform Maps**. The solution involves loading the source data, creating the required target table and Transform Map, mapping the source fields to the corresponding target fields, and transforming the records into the ServiceNow table. **Map Assist** and **Coalesce** are also considered as part of the mapping process to support accurate field mapping and appropriate record matching. The team selected this problem because it provides a structured approach to data migration while reducing manual data-entry effort.

Step-2: Brainstorm, Idea Listing and Grouping

The team brainstormed different approaches for importing employee data into ServiceNow and grouped the ideas according to their method of data entry, data import, field mapping, and record management. The main ideas identified were manual employee record creation, direct data entry, importing data through Import Sets, mapping source fields to target fields using Transform Maps, using Auto Map Matching Fields, using Map Assist for specific field mappings, and using Coalesce to identify matching records.

The ideas were then organized based on their role in the overall data-import process. Manual data entry was considered as a basic approach, while Import Sets and Transform Maps were identified as the main components for structured data import. Auto Map Matching Fields and Map Assist were grouped under field mapping, whereas Coalesce was considered for record matching and avoiding inappropriate duplicate record creation. Through this brainstorming and grouping process, the team identified the Import Set and Transform Map approach as the most suitable foundation for the project.

Step-3: Idea Prioritization

After brainstorming and grouping the possible approaches, the team evaluated each idea based on **relevance to the problem, feasibility, accuracy, implementation effort, and**

usefulness in ServiceNow. Manual data entry was given lower priority because it requires more effort when handling multiple records and increases the possibility of data-entry errors. Direct database modification was also given low priority because it does not provide a structured data-import workflow within ServiceNow.

The team prioritized the **Import Set and Transform Map approach** because it provides a systematic way to transfer employee data from a source file into the required ServiceNow target table. Within this approach, **Auto Map Matching Fields and Map Assist** were prioritized for accurate source-to-target field mapping, while **Coalesce** was included to support appropriate record matching during transformation. The selected approach was considered the most suitable for the project because it is feasible to implement, easy to verify through **Transform History**, and directly addresses the requirement of importing employee data into ServiceNow.

Final Selected Idea: Import Data Using Transform Maps in ServiceNow.
