Maximum Marks	2 Marks

Customer Problem Statement:

The customer is a ServiceNow administrator responsible for maintaining employee information in the system and needs a reliable way to import employee data from an external source file into a ServiceNow target table. Manually entering each employee record is time-consuming and may result in data-entry errors, especially when handling multiple records. The customer also needs to ensure that source fields are correctly mapped to the corresponding target fields and that existing records are appropriately identified during the transformation process. Therefore, the customer requires a structured data-import process using **Import Sets and Transform Maps**, supported by **Map Assist and Coalesce**, to improve the accuracy, consistency, and efficiency of employee data import.

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	A ServiceNow administrator responsible for maintaining employee records.	Import employee data into the ServiceNow target table accurately and efficiently.	Manually entering each employee record takes time and can lead to data-entry errors	A large number of employee records may need to be transferred from a source file into ServiceNow.	Concerned about the time required and the accuracy of manually entered employee records.

PS-2	A ServiceNow data operator responsible for importing employee information from external files.	Map source employee fields correctly to the corresponding target fields and update the records through transformation.	Incorrect or incomplete field mapping can cause imported data to be placed in the wrong target fields.	The source and target tables may contain different field names or structures, requiring proper mapping and record matching.	Concerned that incorrect mapping or record matching may affect the accuracy and consistency of the imported data.
