Project Design Phase
Solution Architecture

Date	3October 2026
Team ID	SWTID-2026-9253
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	4 Marks

Solution Architecture:

Solution Architecture – Import Data Using Transform Maps (Spreadsheet)

- **Input: Employee data is provided through a spreadsheet file.**
- **Import Set: The spreadsheet is uploaded into a ServiceNow Import Set.**
- **Import Set Table: The imported spreadsheet records are temporarily stored in the Import Set table.**
- **Transform Map: A Transform Map connects the source Import Set table with the Employee Test target table.**
- **Field Mapping: Source fields are mapped to their corresponding target fields using Auto Map Matching Fields and Map Assist.**
- **Coalesce: A selected field is configured as Coalesce to identify matching records during transformation.**
- **Data Transformation: The mapped employee records are transformed from the Import Set into the Employee Test table.**
- **Target Table: Successfully transformed employee records are stored in the Employee Test table.**
- **Verification: Transform History is used to check the transformation execution and verify the import results.**

Architecture Flow:
Spreadsheet → Import Set → Import Set Table → Transform Map → Auto Map / Map Assist → Coalesce → Employee Test Table → Transform History
