# Import Data Using Transform Maps (Spreadsheet)

## 1. Introduction

- **Project Title: Import Data Using Transform Maps (Spreadsheet)**
- **Team Members:**

| S.No. | Team Member | Role |
|---|---|---|
| 1 | Harani | Import Set, Verification & Documentation |
| 2 | Nithish | Transform Map & Field Mapping |
| 3 | Kamalesh | Coalesce & Data Transformation |

## 2. Project Overview

- **Purpose**

The purpose of this project is to provide a structured method for importing employee data from a spreadsheet into ServiceNow. The solution uses Import Sets and Transform Maps to transfer source data into the Employee Test target table. Auto Map Matching Fields and Map Assist are used for field mapping, while Coalesce supports appropriate record matching. Transform History is used to verify the transformation results.

- **Features:**

Import employee data from a spreadsheet.

Store imported records in an Import Set table.

Create a Transform Map between source and target tables.

Map fields using Auto Map Matching Fields.

Use Map Assist for required field mappings.

Configure Coalesce for record matching.

Transform employee data into the Employee Test table.

Verify transformation results using Transform History.

## 3. Architecture

**Architecture Description**

The employee spreadsheet is uploaded into ServiceNow through an Import Set. The imported records are stored in the Import Set table. A Transform Map connects the source table with the Employee Test target table. Source fields are mapped to the corresponding target fields using Auto Map Matching Fields and Map Assist. Coalesce is configured to identify matching records during transformation. The transformed records are stored in the Employee Test table and the result is verified using Transform History.

.

## 4. Setup Instructions

**Prerequisites**

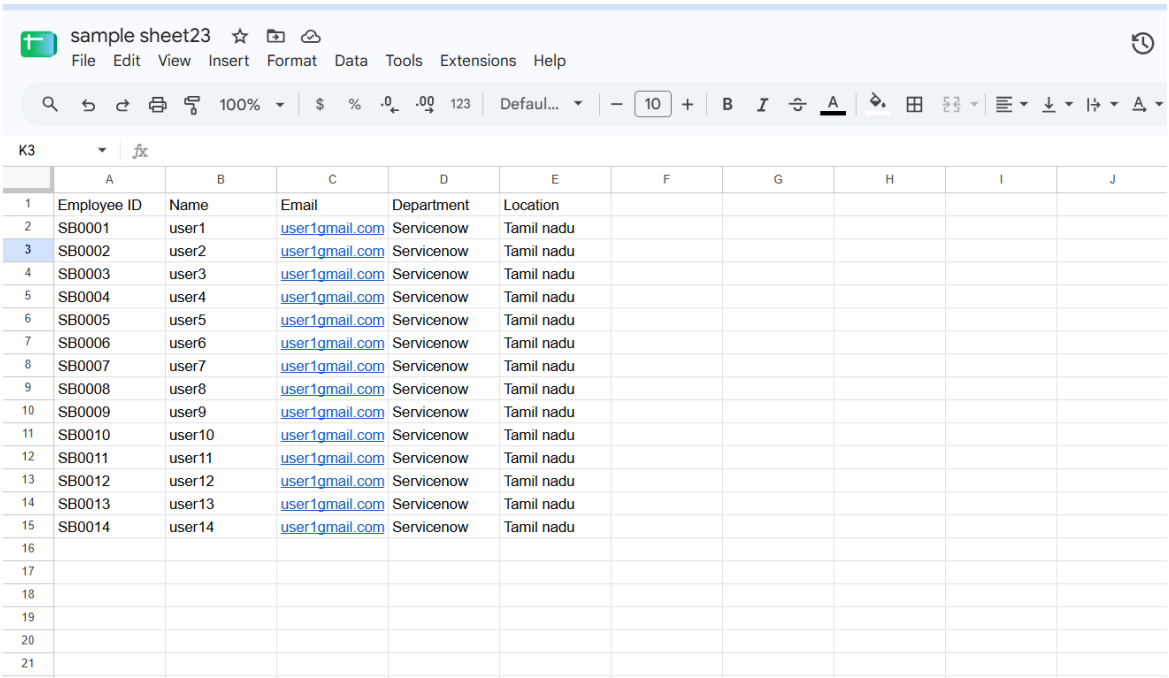

- ServiceNow Developer account/instance.
- Access to the ServiceNow platform.
- Employee spreadsheet containing the required source data.
- Required permissions to create/import tables and Transform Maps.

**Setup Procedure**

1. Log in to the ServiceNow Developer instance.
2. Prepare the employee spreadsheet.

# Import Data Using Transform Maps (Spreadsheet)

3. Import the spreadsheet into an Import Set.
4. Verify the imported source records.
5. Create the Employee Test target table.
6. Create a Transform Map between the Import Set table and Employee Test table.
7. Configure field mappings using Auto Map Matching Fields and Map Assist.
8. Configure the required Coalesce field.
9. Transform the imported data.
10. Verify the result using Transform History.

| | A | B | C | D | E | F | G | H | I | J |
|---|---|---|---|---|---|---|---|---|---|---|
| 1 | Employee ID | Name | Email | Department | Location | | | | | |
| 2 | SB0001 | user1 | user1gmail.com | Servicenow | Tamil nadu | | | | | |
| 3 | SB0002 | user2 | user1gmail.com | Servicenow | Tamil nadu | | | | | |
| 4 | SB0003 | user3 | user1gmail.com | Servicenow | Tamil nadu | | | | | |
| 5 | SB0004 | user4 | user1gmail.com | Servicenow | Tamil nadu | | | | | |
| 6 | SB0005 | user5 | user1gmail.com | Servicenow | Tamil nadu | | | | | |
| 7 | SB0006 | user6 | user1gmail.com | Servicenow | Tamil nadu | | | | | |
| 8 | SB0007 | user7 | user1gmail.com | Servicenow | Tamil nadu | | | | | |
| 9 | SB0008 | user8 | user1gmail.com | Servicenow | Tamil nadu | | | | | |
| 10 | SB0009 | user9 | user1gmail.com | Servicenow | Tamil nadu | | | | | |
| 11 | SB0010 | user10 | user1gmail.com | Servicenow | Tamil nadu | | | | | |
| 12 | SB0011 | user11 | user1gmail.com | Servicenow | Tamil nadu | | | | | |

## 5. Folder Structure

**ServiceNow Project Components**

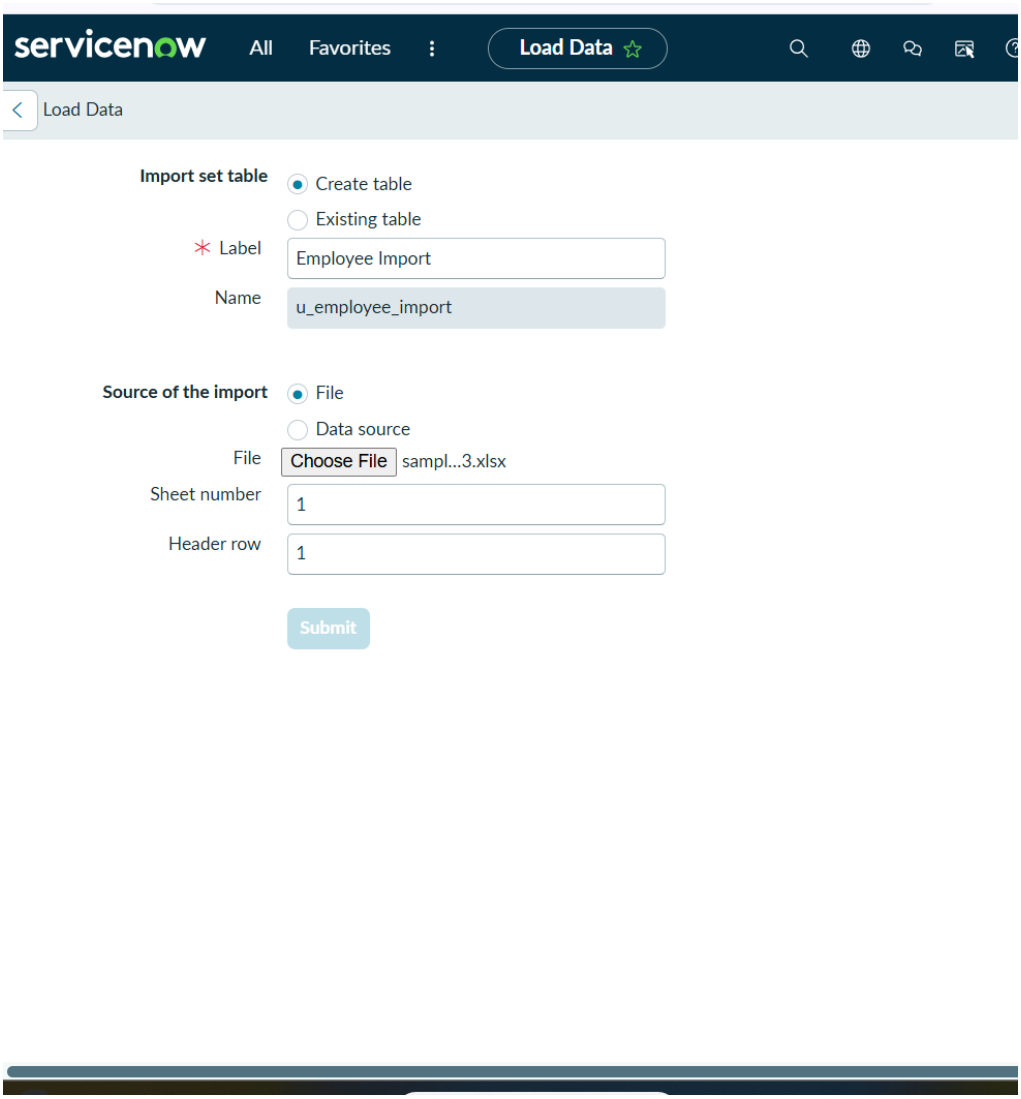

| Component | Purpose |
|---|---|
| Source | Contains employee data to be imported |

# Import Data Using Transform Maps (Spreadsheet)

| Component | Purpose |
| --- | --- |
| Spreadsheet | |
| Import Set | Handles the spreadsheet data import |
| Import Set Table | Stores imported source records |
| Transform Map | Defines source-to-target transformation |
| Auto Map Matching Fields | Automatically identifies matching field names |
| Map Assist | Supports manual/specific field mapping |
| Coalesce | Identifies matching records |
| Employee Test Table | Stores transformed employee records |
| | Provides transformation execution results |

# Import Data Using Transform Maps (Spreadsheet)

| Component | Purpose |
| --- | --- |

## 6. Running the Application

### Execution Steps

1. Open the ServiceNow Developer instance.
2. Navigate to the Import Set functionality.
3. Upload the employee spreadsheet.
4. Verify the imported records.
5. Open/create the Transform Map.
6. Configure Auto Map Matching Fields / Map Assist.
7. Configure Coalesce.

8. Execute the transformation.
9. Open Transform History.
10. Verify the transformation result in the Employee Test table.

## 7 Mapping and Transformation

Field Mapping

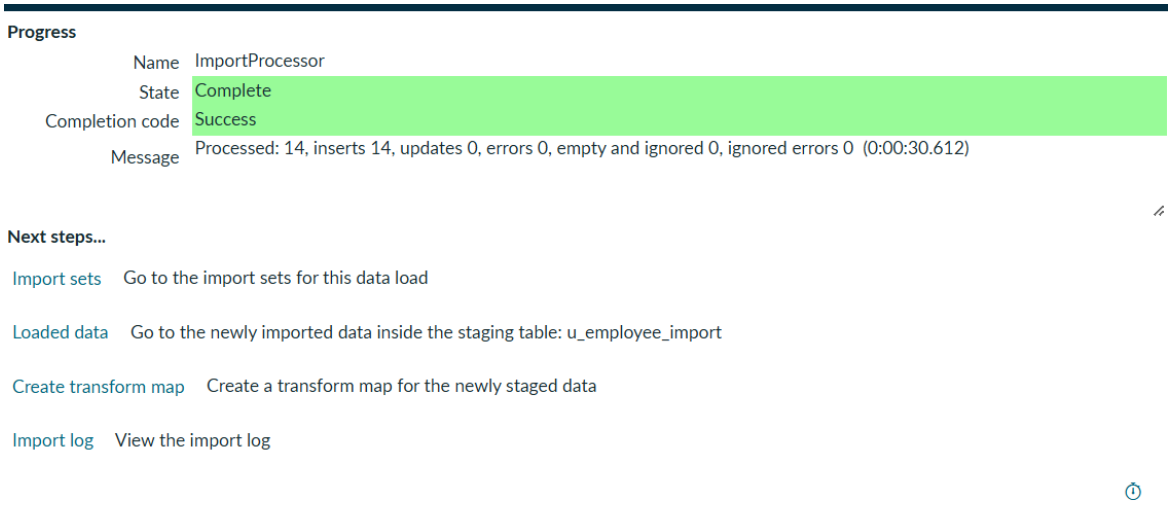

The source spreadsheet fields are mapped to the corresponding fields in the Employee Test target table. Auto Map Matching Fields is used to identify matching field names, while Map Assist is used where specific source-to-target mappings are required.

Coalesce Configuration

Coalesce is configured on the selected employee field to help ServiceNow identify whether an imported record corresponds to an existing target record during transformation.

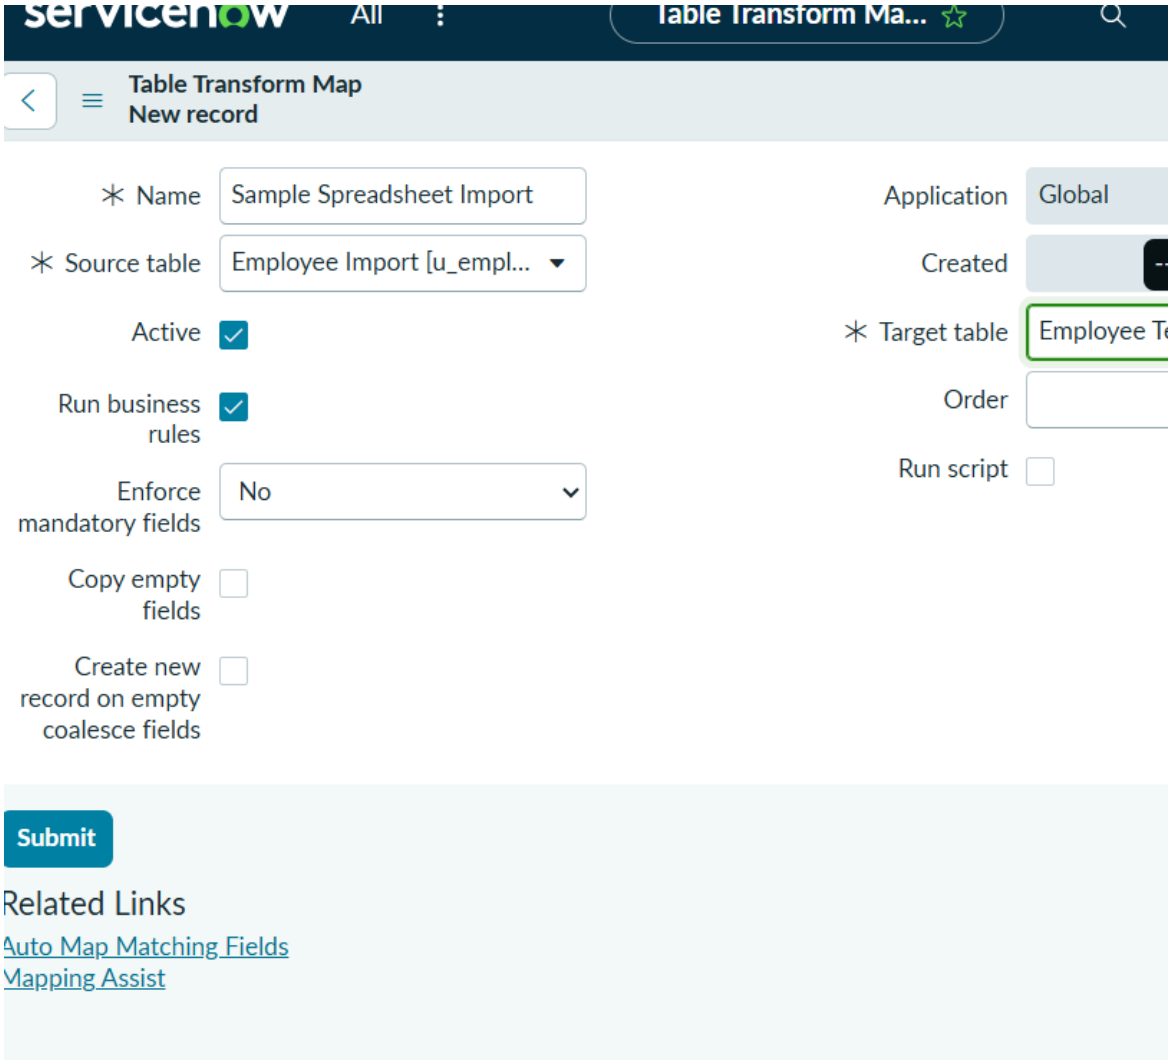

Data Transformation

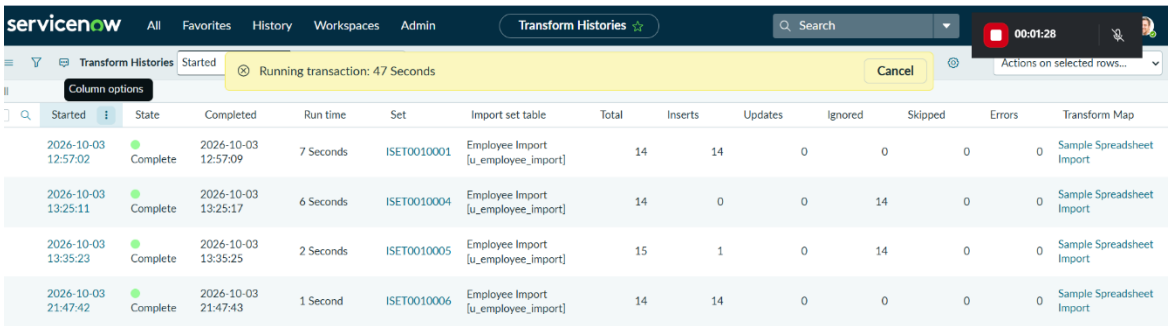

After completing the field mappings and Coalesce configuration, the employee data

is transformed from the Import Set into the Employee Test table.

# Import Data Using Transform Maps (Spreadsheet)

## . 8. Authentication

**Testing Strategy**

The project is tested by verifying whether the employee spreadsheet data is correctly imported, mapped, transformed, and stored in the Employee Test table.

# Import Data Using Transform Maps (Spreadsheet)

**Test Cases**

| Test Case | Expected Result | Status |
|---|---|---|
| Import spreadsheet | Employee records appear in Import Set | Pass |
| Create Transform Map | Source and target tables are connected | Pass |
| Field Mapping | Required fields are correctly mapped | Pass |
| Coalesce | Matching records are appropriately identified | Pass |
| Transform Data | Records appear in Employee Test table | Pass |
| Transform History | Transformation result is displayed | Pass |

**Model Performance Testing**

**Not Applicable.** No machine-learning model is used in this project. The project uses ServiceNow's built-in Import Set, Transform Map, field-mapping, Coalesce, and Transform History features.

**9. User Interface**

The project uses the **ServiceNow Web UI** rather than a separately developed frontend.

The main interfaces used are:

- Import Set interface
- Transform Map configuration
- Field Mapping interface
- Map Assist
- Coalesce configuration
- Employee Test table

- Transform History

## 10. Testing

• Describe the testing strategy and tools used.

## 11. Screenshots or Demo

Demo Description:

The demonstration shows the spreadsheet-based employee data import process, Transform Map configuration, field mapping using Auto Map Matching Fields and Map Assist, Coalesce configuration, and verification of the transformation result through Transform History.

## 12. Known Issues

- The project depends on access to a ServiceNow Developer instance.
- Transformation cannot be performed until the required Import Set and Transform Map configurations are completed correctly.
- Incorrect field mapping can result in incorrect target data.
- Incorrect Coalesce configuration can affect how existing records are matched.
- The availability of the ServiceNow Developer instance may depend on instance access

and availability.

## 13. Future Enhancements

- Support additional employee spreadsheet formats and data structures.
- Add more advanced validation rules before transformation.
- Add additional field-mapping rules for different employee datasets.
- Improve duplicate-record detection using additional matching fields.
- Add automated notifications after successful or failed transformations.
- Extend the solution to support multiple employee data sources.
- Add detailed reporting and dashboards for import and transformation activities.
